

Expanding Wetlaid Filtration Media Performance Through Innovation and Enhanced Product Testing

**Kent Williamson
Ahlstrom-Munksjö**

Wetlaid has played a major role in production of filtration media for many years. Due to its versatility this technology has been challenged and continues to evolve allowing to produce unique specialized products. Capitalizing on the latest asset investments coupled with new and enhanced raw materials, Wetlaid will continue to play a prominent role into the future.

The way filter media is analyzed through standards and bench testing continues to improve in order to better understand the challenges. The ability to develop close-to-real-life testing methods has become essential to speed up the innovation cycle and deliver the performance aligned with needs of the end user.

Combining the advances in production technology with tests that better mimic the real environment enhances the capability to create new products and solutions for current and future filtration needs.
